Trip Report - AB-18 Base Station Automatic Receivers

## 1. Project Description!

This task provides for the fabrication of two AR-18 automatic base station receivers. The unit automatically recognizes and receives high speed Tri-phase (1480 upm) RS-18 field set transmissions. The output is a punched teletype tape at a 1480 upm rate.

## 2. Contractual Information:

a. Initial Cost: \$146,072 Increase in Scope: \$11,664

b. Inditiation Date: 1 April 1962 c. Completion Date: 1 December 1962

d. Deliverable Items: 2 each Prototypes

3. Date of Meeting: 1 August 1962

new system test similator has been completed and it has proven to be very reliable and precise. The similator was changed from an unsatisfactory electro-mechanical commutator to a beam exitching tube counter commutator approach. System tests on letter synchronization and the upper case functions have been completed and the overall speed tolerance of the AN-18 is + 3%. Speed variations of some time + 35 cause errors due to sampling of the phase detector cutsuse during the multi-path protection interval. At the + 35 limits, the letter spac is able to hold synchronization during an 18 pulse fade interval. The upper case circuitry to change the gratem from a 27 to a 32 level code performs in a very reliable numer. The modifications of the dual diversity receiver using new translators has been completed and the electrical performance of this unit has been greatly improved. The febrication of other sub-quits of the system is progressing well. The purchase of all remaining components for two deliverable units has been imitiated.

Adding subcountic encryption, NG-3, provisions in the AR-18 were discussed with the contractor. The contractor did not feel that NG-3 operation would take very much miditional elecultry and controls. Therefore, the rack height will be increased by 7" to provide for possible NG-3 addition and later replacement of the present receivers with strip receivers and bit cycle first order recognition so that one AR-18 could menter more than one RF channel. It is felt that the space should be added at this time to provide for later modification. Also discussed with the contractor was the possibility of modifying the government furnished AR-18 insecondance with the modifications derived from this progress. The contractor was requested to provide a budgetary estimate of the cost to modify the government furnished equipment.
